

Second: Your Operational Counterpart

People with ADHD don't usually struggle with making decisions—they struggle with remembering, organizing, and creating a starting point.

Every day, small but important pieces of information get buried in messages, emails, and notifications. A friend says, *"Let's meet on Friday at 6."* You subscribe to a streaming service. Someone mentions a birthday. Individually they're simple, but together they create mental overload.

Second is a personal operational counterpart that remembers what **you choose** to remember.

Whenever you come across something important, simply **Share** → **Second**.

With a single tap, you can:

- Save a WhatsApp message as a calendar event or reminder.
- Save a subscription confirmation to automatically track the billing amount, renewal date, and billing cycle.
- Save a birthday or important date to be reminded at the right time.
- Save anything you don't want your brain to keep carrying.

Second is built around one principle: **trust**.

It does **not** continuously monitor your phone, read your conversations, or use AI to learn your personal life. It only stores the information you explicitly choose to send to it.

AI is used only to understand the item you shared—for example, identifying a date, time, or subscription amount—and convert it into structured information. Once that's done, the original information is simply stored securely and used for reminders and organization. There is no continuous AI processing of your personal data.

You stay in complete control of what enters Second, what is stored, and what is forgotten.

Second isn't another productivity app. It's a trusted operational counterpart that quietly remembers, organizes, and reminds you—so your mind is free to focus on thinking, creating, and making decisions.
