

Screens

I think we should think in terms of the **life of an item**.

Everything in Second revolves around an item.

An item could be:

- WhatsApp message
- Email
- Screenshot
- Subscription
- Birthday
- Flight ticket
- PDF
- Link
- Bill
- Random note

Every item follows the same journey.

Once we adopt this philosophy, the app becomes much simpler.

Screen Inventory (MVP)

1. Splash Screen

Purpose

Introduce the brand while loading.

Shows

- Logo

- “Second”
- Loading

2. Onboarding

Purpose: Explain the product in 3 screens.

1. Screen 1: Stop carrying everything in your head.
2. Screen 2: Send important information to Second.
3. Screen 3: Second remembers it for you.

3. Permissions

Purpose: Request only necessary permissions.

Examples

- Notifications
- Calendar
- Contacts (future)

Never ask for everything.

4. Sign In

Simple.

1. Apple
2. Google
3. Email

HOME

This is NOT a dashboard. This is your COO.

Schedules reminders.

Navigation

I think the app should only have **four primary tabs**.

 Home
 Inbox
 Search
 Profile

Everything else is accessed contextually:

- Calendar from Home or Search
- Memory Vault from Search or Home
- Subscription Manager from Home
- Reminder details from notifications

This keeps the primary navigation extremely simple and avoids turning Second into another complex productivity app.

One structural recommendation

I would actually **remove separate Calendar, Reminder, and Subscription tabs**.

Instead, make them **views over the same underlying “Items” database**.

Think of it this way:

The user doesn't care where data is stored—they care about finding and acting on it. By treating everything as an **Item** with different representations, you simplify both the user experience and the engineering architecture, while making it much easier to add new item types (e.g., bills, travel bookings, warranties) in the future without redesigning the app.
